Help Your Patients Achieve Nutritional Balance

The first diagnosis a nutritionist should make is whether or not your patient is consuming the proper nutrients to be healthy and support their body's ability to stay healthy.

Nine out of ten Americans are nutrient deficient, according to a study conducted in 2011 that analyzed government food consumption survey data and was widely reported in the press.

Nutrients such as amino acids, enzymes, fatty acids, vitamins and minerals are the building blocks of the body. They provide the body's cells with energy, support metabolism, and are needed to sustain good health.

Nutritional deficiencies and imbalances can be caused by poor dietary habits but also by diseases, inability to absorb nutrients, stress and food sensitivities. When key nutrients become deficient, many metabolic processes are affected. The body may initially try to compensate for these imbalances, however, if they are prolonged, they might contribute to health issues.

Start With a Good Multi-Vitamin

A variety of clinical laboratory tests can identify specific nutritional deficiencies, however with problems being so widespread, the recommendation of a good multi-vitamin is a good starting point for nutritional therapy.

Kirkman® offers many multi-vitamin supplements from which to choose. All of Kirkman's products are UltraTested® for more than 950 environmental contaminants, a quality standard that no other nutritional supplement company offers. Kirkman® has more than 67 years experience in producing quality formulations that address our customers' specific health needs.
